

1. Does income alone determine the desire to drive?

Link -

<https://public.tableau.com/app/profile/oladipupo.adenowun/viz/Doesincomealonedeterminedesiretodrive/Dashboard>

Summary: Based on US Census 2015 data, I set out to find out if the driving population is those earning higher income. The national income average is \$46,130, so this became the benchmark to split the states and counties into “below and above” with colors.

Clicking from the state map drills down into county-level map view and a bar chart showing the number of people that drive

From the dashboard we can infer that people drive regardless of income, as in many counties with low income, a sizable amount of people drives.

Design: The components used for the visualization are:

- Map: for fields with geographic information (state & county)
- Histogram: used to determine the spread of the data
- Bar chart: to display categorical data (driving population across counties)
- Color: orange and blue colors used to aid people with color-blindness
- Set: to group states and counties based on the national income average

Resources: N/A

2. Does unemployment correlate with poverty in the United States, and who are affected?

Link -

<https://public.tableau.com/app/profile/oladipupo.adenowun/viz/Doesunemploymentcorrelatewithpoverty/Dashboard>

Summary: Based on US Census 2015 data, I set out to find out if poverty has any correlation with unemployment across the counties. The national poverty average is 944, so this became the benchmark to split the states into “below and above” with colors.

Clicking from the state map drills down into county-level map view with a tooltip bar chart showing the population split by race

From the scatterplot on the dashboard, we can infer that there is a positive correlation between poverty and unemployment across the counties.

Design: The components used for the visualization are:

- Map: for fields with geographic information (state & county)
- Histogram: used to determine the spread of the data
- Bar chart: to display categorical data (population mix by race)
- Scatter plot: to display the correlation between poverty and unemployment data across state and county
- Color: color-blind color palette used to aid people with color-blindness
- Set: to group states based on the national poverty average

Resources: N/A

3.What does employment look like across United States

Link -

<https://public.tableau.com/app/profile/oladipupo.adenowun/viz/WhatdoesemploymentlooklikeacrossUnitedStates/Dashboard>

Summary: Based on US Census 2015 data, I set out to show employment spread across the states and counties.

Clicking from the state map drills down into county-level map view with a tooltip showing the % of the population that are employed and a bar chart showing the job types.

The dashboard shows the spread of employment across the counties.

Design: The components used for the visualization are:

- Map: for fields with geographic information (state & county)
- Bar chart: to display categorical data (driving population across counties)
- Color: colors from orange-blue-white diverging color palette are used to aid people with color-blindness
- Calculated Field: to get the percentage of the population that are employed
